High-Performance Computing

Parallel Programming in OpenMP – part III

Outline

- Runtime library
- Environment variables
- OpenMP Future
- Behind the scenes
- Summary
- References

Programming OpenMP

Programming OpenMP

OpenMP Runtime Library

The OpenMP runtime library: support functions

02614 - High-Performance Computing

69

OpenMP Runtime Library

The OpenMP standard defines an API for library calls, that have a variety of functions:

- query
 - the number of threads/processors
 - □ thread ID, "in parallel"
- □ set
 - the number of threads to use
 - scheduling mode
- locking (semaphores)

OpenMP Runtime Library

Name

omp_set_num_threads omp_get_num_threads omp_get_max_threads omp_get_thread_num omp_get_num_procs omp_in_parallel

omp_set_dynamic
omp_get_dynamic

omp_set_nested
omp_get_nested

omp_get_wtime
omp_get_wtick

Functionality

set number of threads

get number of threads in team get max. number of threads

get thread ID

get max. number of processors check whether in parallel region

activate dynamic thread adjustment check for dynamic thread adjustment

(implementation can ignore this)

activate nested parallelism check for nested parallelism

(implementation can ignore this)

returns wall clock time number of second between clock ticks

January 2018

02614 - High-Performance Computing

71

OpenMP Runtime Library

Function prototypes:

```
void omp_set_num_threads(int num_threads)
int omp_get_num_threads(void)
int omp_get_max_threads(void)
int omp_get_thread_num(void)
int omp_get_num_procs(void)
int omp_in_parallel(void)

void omp_set_dynamic(int dynamic_threads)
int omp_get_dynamic(void)
void omp_set_nested(int nested)
int omp_get_nested(void)

double omp_get_wtime(void)
double omp_get_wtick(void)
```

OpenMP 3.0 Runtime Library

Name

omp_set_schedule
omp get schedule

omp_get_thread_limit

omp_set_max_active_levels omp_get_max_active_levels omp_get_level omp_get_ancestor_thread_num

omp_get_team_size
omp_get_active_level

Functionality set the schedule get the schedule

max. number of available threads in the implementation

set the number of nested levels get the number of nested levels returns the current nesting level returns thread id of the ancestor thread in specified level get team size at specified level returns the number of enclosing, active nested parallel regions

for more details see the OpenMP 3.0 specifications

January 2018

02614 - High-Performance Computing

73

OpenMP Runtime Library

Usage of omp_get_num_threads() vs omp_get_max_threads():

```
// get the number of threads
threads = omp_get_max_threads();

returns value of OMP_NUM_THREADS

// get the number of threads
threads = omp_get_num_threads();

returns 1- outside a parallel region

#pragma omp master
{
    threads = omp_get_num_threads();
}
    // end parallel
    returns value of threads in a parallel region
```

OpenMP Runtime Library

Measuring time:

☐ It is most useful to compare wall clock times

```
double ts, te;
ts = omp_get_wtime();

do_work();

te = omp_get_wtime() - ts;

printf("Elapsed time: %lf\n", te);
```

clock() returns the accumulated CPU time of all threads!

January 2018

02614 - High-Performance Computing

75

OpenMP Environment Variables

Controlling OpenMP via Environment Variables

OpenMP Environment Variables

- □ OMP NUM THREADS = n
 - \square sets the max. no of threads to n (default: 2)
- OMP_SCHEDULE = schedule[,chunk]
 - schedule: [static | guided | dynamic]
 - chunk: size of chunks (defaults: [n/a|1|1])
 - Note: applies to parallel do/for loops only!
- OMP_DYNAMIC = [TRUE | FALSE]
- OMP_NESTED = [TRUE | FALSE]

January 2018

02614 - High-Performance Computing

77

OpenMP 3.0 Environment Variables

- OMP_STACKSIZE = size[B|K|M|G]
 - sets the size of the stack of OpenMP threads
 - default unit: Kilobytes
- □ OMP WAIT POLICY = active|passive
 - controls the behaviour of idle threads
 - □ active: "spinning threads", i.e. use cycles
 - passive: threads go to sleep
 - the default is implementation dependent

OpenMP 3.0 Environment Variables

- □ OMP_MAX_ACTIVE_LEVELS = n
 - controls the max. level for nested parallellism
- □ OMP_THREAD_LIMIT = n
 - sets the maximum number of threads for an OpenMP program

January 2018

02614 - High-Performance Computing

79

OpenMP Environment Variables

Oracle Studio specific variables:

- □ SUNW_MP_WARN = [TRUE | FALSE]
 - issues warnings, e.g. when requesting too many threads, ...
- □ SUNW_MP_THR_IDLE = [SPIN | SLEEP(t)]
 - behaviour of the idle threads
 - □ t is the time (in seconds/miliseconds default: 5 ms) the idle threads spin before they go to sleep
 - □ Ex.: SUNW MP THR IDLE=SLEEP(50ms)
 - □ OpenMP 3.0: use OMP WAIT POLICY!

OpenMP Environment Variables

Notes:

- □ All the defaults (in green) given above are for the Oracle Studio OpenMP implementation.
- □ The max. number of threads is limited to the number of on-line processors (cores) in the system. This can be changed by setting OMP_DYNAMIC to FALSE – be careful when playing with this.
- □ Check with your compiler documentation, what the defaults are for different OpenMP implementations, e.g. Intel, GCC, or

January 2018

02614 - High-Performance Computing

82

OpenMP Precedence

- Level of priority:
 - 1 clauses, e.g. num threads(...)
 - 2 library calls, e.g. omp_set_num_threads(...)
 - 3 environment variables, e.g. OMP NUM THREADS
- For a detailed discussion see the OpenMP specifications or check the documentation of your OpenMP implementation.

OpenMP Future

OpenMP standard extensions: Coming soon to a compiler near you ...

```

OpenMP Future: Autoscoping

- available with the Oracle Studio compilers
- if the compiler can't autoscope, you will get a message why it failed
 - □ use -xvpara to see the messages
 - the failure message is on the .o file as well, make it visible with the er_src command
- □ is a proposed extension for an upcoming OpenMP standard (didn't make it into OpenMP 3.0, 4.0, 4.5, ...)

January 2018

02614 - High-Performance Computing

86

OpenMP Future

- More extensions were/are discussed in the OpenMP ARB and the community,andmade or make it into the standard, e.g. extensions for
 - better performance
 - memory placement (4.0)
 - debugging
 - checks, both at compile- and run-time
 - exception handling (4.0)
 - access to accelerators (e.g. GPUs) (4.0)

OpenMP: Behind the scenes

What the compiler does with your code

02614 - High-Performance Computing

88

OpenMP: Behind the scenes

```
#define MAX SIZE 8000000
int main() {
    double GlobSum;
                              /* A global variable */
    double array[MAX SIZE];
    int nthreads;
    int i;
    /* Initialize things */
    for (i=0; i<MAX SIZE; i++) array[i] = i;
    GlobSum = 0;
    nthreads = omp get max_threads();
    printf("Threads: %d\n", nthreads );
    #pragma omp parallel for private(i) \
            reduction(+ : GlobSum)
    for(i=0; i<MAX SIZE;i++)</pre>
        GlobSum = GlobSum + array[i];
    return (EXIT SUCCESS);
```

OpenMP: Behind the scenes

- Used the OMPi compiler to generate the intermediate code shown on the next slides.
- ☐ The actual implementation differs from compiler to compiler, and probably also from version to version (improvements).

January 2018

02614 - High-Performance Computing

90

OpenMP: Behind the scenes

```
int main() {
    . . .
    int
           i;
    omp initialize();
    for (i = 0; i < 8000000; i++) array[i] = i;
    GlobSum = 0;
    nthreads = omp get max threads();
    printf("Threads: %d\n", nthreads);
/* #pragma omp parallel for private(i) reduction(+: GlobSum) */
    OMP PARALLEL DECL VARSTRUCT (main parallel 0);
     OMP PARALLEL INIT VAR (main parallel 0, GlobSum);
    OMP PARALLEL INIT VAR (main parallel 0, array);
    _omp_create_team((-1), _OMP_THREAD, main_parallel_0,
        (void *) &main parallel 0 var); /* create team of
    _omp_destroy_team(_OMP_THREAD->parent);
    return 0;
```

OpenMP: Behind the scenes

```
void *main_parallel_0(void *_omp_thread_data) {
          omp dummy = omp assign key( omp thread data);
  double (*array)[8000000] = & OMP VARREF(main parallel 0,array);
  {
    int
    double GlobSum = 0;
            _omp_start, _omp_end, omp incr, omp last iter = 0;
    int
             omp for id = omp module.for ofs + 0;
    int
    int
            (* omp sched bounds func) (int, int, int, int,
                             int, int *, int *, int, int, int *);
    /* static with chunksize or runtime */
            _{\rm omp\_init\_start}, _{\rm omp\_nchunks}, _{\rm omp} c = 0,
             omp chunksize;
     omp incr = (1);
    _omp_init_directive(_OMP_FOR, _omp_for_id, 0,
                         omp incr, 0, 115);
    omp sched bounds func = omp static bounds;
    _omp_static_bounds_default(8000000, 0, _omp_incr,
                                & omp start, & omp end);
    . . .
```

January 2018

02614 - High-Performance Computing

92

OpenMP: Behind the scenes

OpenMP vs POSIX threads

A possible POSIX threads solution:

```
main() {
  int i, retval;
  pthread t tid;
  /* Initialize things */
  pthread attr init(&attr);
  pthread mutex init (&my mutex, NULL);
  pthread attr setscope (&attr, PTHREAD SCOPE SYSTEM);
  for (i=0; i<MAX SIZE; i++) array[i] = i;
  GlobSum = 0;
  for(i=0;i<ThreadCount;i++) {</pre>
    index[i] = i;
    retval = pthread create(&tid, &attr, SumFunc,
                              (void *)index[i]);
    thread id[i] = tid;
  }
  for(i=0;i<ThreadCount;i++)</pre>
    retval = pthread join(thread id[i], NULL);
```

January 2018

02614 - High-Performance Computing

94

OpenMP vs POSIX threads

```
void *SumFunc(void *parm) {
  int i, me, chunk, start, end;
  double LocSum;
  /* Decide which iterations belong to me */
 me = (int) parm;
  chunk = MAX_SIZE / ThreadCount;
  start = me * chunk;
  end = start + chunk; /* C-Style - actual element + 1 */
  if ( me == (ThreadCount-1) ) end = MAX SIZE;
  /* Compute sum of our subset*/
  LocSum = 0;
  for(i=start;i<end;i++ ) LocSum = LocSum + array[i];</pre>
  /* Update the global sum and return */
 pthread mutex lock (&my mutex);
  GlobSum = GlobSum + LocSum;
  pthread mutex unlock (&my mutex);
```

Note: Variable definitions are omitted in this example!

OpenMP Summary

Short summary of the three lectures

02614 - High-Performance Computing

96

OpenMP Summary

- OpenMP: a parallel programming model for SMP computers
- compiler directives, support functions, environment variables
- easy to implement, also "little by little"
- next lecture: "OpenMP & Performance"
